 Patient Name

 Procedure(s)

 Please initial

As the owner/authorized agent for the above named patient, I give consent for MAH to induce and maintain anesthesia for the scheduled procedure. I understand that even in the healthiest of patients there is the potential for complications with all anesthetic procedures and assume responsibility of this risk, authorizing the attending DVM to proceed as necessary given the occurrence of any complication.

YES**NO**

To further minimize anesthetic risk, a pre-anesthetic blood panel can be performed to assess organ function, which screens my pet for any potential underlying issues not detectable on physical examination. I understand that this bloodwork is an additional cost and approve the highly recommended pre-anesthetic blood panel.

YES**NO**

Intravenous fluids are given via a catheter during general anesthetic procedures to help maintain blood pressure, circulation to vital organs and improve anesthetic recovery. The IV catheter also facilitates rapid administration of drugs should complications develop. I understand this option is an additional cost and approve the highly recommended IV catheter and fluids, if warranted.

YES**NO**

Microchips are an important part of pet ownership. In the event your pet becomes separated from you, any shelter or veterinary facility has the ability to scan the microchip for information. Would you like to have your pet microchipped today?

YES**NO**

All patients are given pain medications dependent on the procedure performed, which is not optional. However, Laser Therapy is an additional, non-invasive treatment for pain and inflammation that can help reduce healing time when administered post-operatively. I understand laser therapy is an additional fee and approve this beneficial therapy in conjunction with regular pain management, if warranted.
